

Project - Backend Dev

Requirements:

1. Build a simple REST API using Laravel for a simple travel planner app
2. This is a simple app, we can create, edit and delete a trip
 - Title
 - Where (origin-destination)
 - Schedule (start and end)
 - Type of the trip
 - Description
 - The trip can be various, it can only one day or in a time range trip
3. Users can access the list of their trip plans
4. Protect this endpoint from the public, only those who have access can hit this endpoint
5. Write a test for this endpoint

Notes:

- Please consider adding any validation needed
- Please share the postman collection and sample payload to test the endpoint
- Send us the URL to your project repository
- Deploy your app somewhere so that it can be checked is a big plus
- If you can store the data in the cache to improve the performance it will be a big plus
